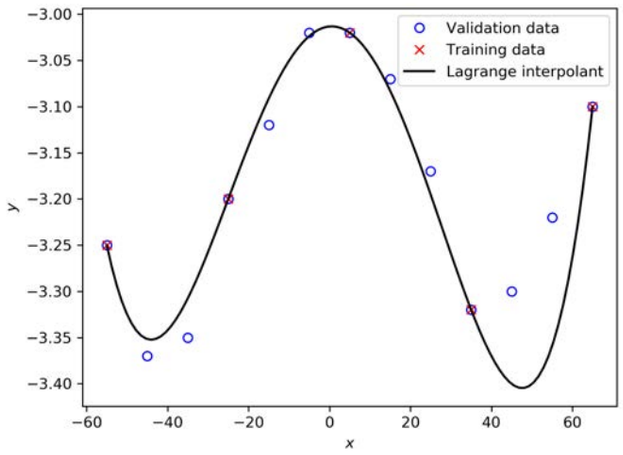
Deterministic vs probabilistic modeling

$\boldsymbol{x}$

Inputs
(deterministic)



$\boldsymbol{y} = f_\theta(\boldsymbol{x})$

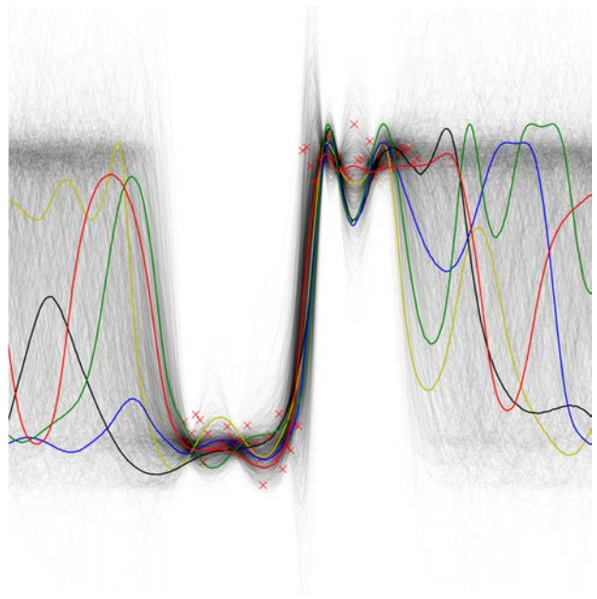
Outputs

Inputs
(random)

$\boldsymbol{z} \sim p(\boldsymbol{z})$

$\boldsymbol{x}$

Inputs
(deterministic)



$p_\theta(\boldsymbol{y}|\boldsymbol{x}, \boldsymbol{z})$

Outputs

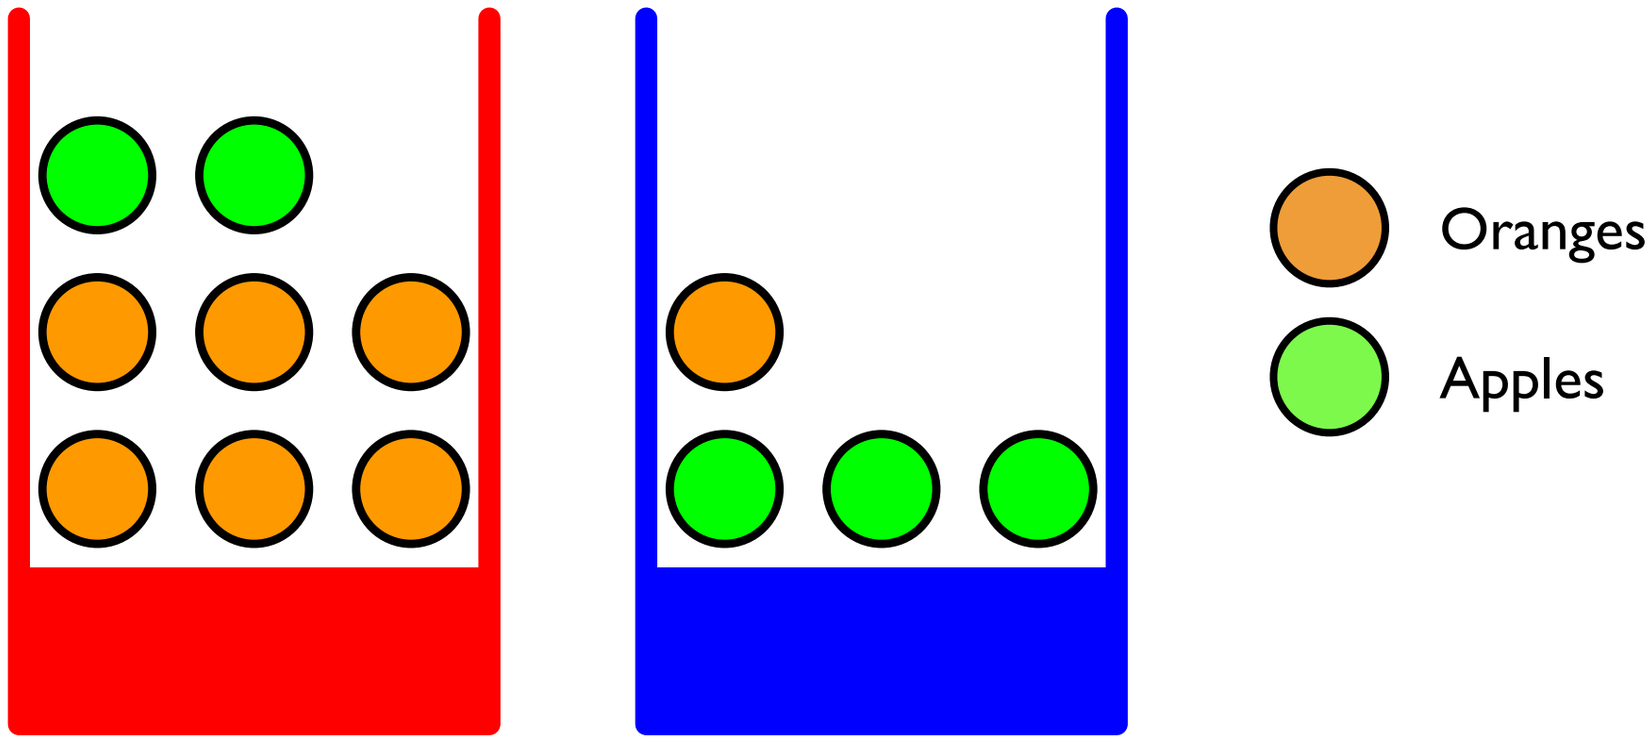
Discrete random variables

Random variables:

- Box ID
- Fruit

$$B = \{r, b\}$$

$$F = \{a, o\}$$



Box 1 Box 2

Suppose we randomly pick one of the boxes and from that box we randomly select an item of fruit, and having observed which sort of fruit it is we replace it in the box from which it came. We could imagine repeating this process many times. Let us suppose that in so doing we pick the red box 40% of the time and we pick the blue box 60% of the time, and that when we remove an item of fruit from a box we are equally likely to select any of the pieces of fruit in the box.

Probability of an event: fraction of times that event occurs out of the total number of trials, in the limit that the total number of trials goes to infinity .

We can now ask questions such as: "what is the overall probability that the selection procedure will pick an apple?", or "given that we have chosen an orange, what is the probability that the box we chose was the blue one?"

Discrete random variables

- A ***discrete random variable*** is one which may take on only a countable number of distinct values such as 0,1,2,3,4,..... Discrete random variables are usually (but not necessarily) counts. If a random variable can take only a finite number of distinct values, then it must be discrete. Examples of discrete random variables include the number of children in a family, the Friday night attendance at a cinema, the number of patients in a doctor's surgery, the number of defective light bulbs in a b
- The ***probability distribution*** of a discrete random variable is a list of probabilities associated with each of its possible values. It is also sometimes called the probability function or the probability mass function.

Basic rules of probability

Sum rule $$p(X) = \sum_Y p(X, Y)$$

Product rule $$p(X, Y) = p(Y|X)p(X)$$

Bayes rule $$p(Y|X) = \frac{p(X|Y)p(Y)}{p(X)}$$
